INTRODUCTION: Current oil-derived plastics endow a very high CO₂ fingerprint

The bad quality of certain wools (Fig. 1 and 2) have rendered them useless in certain parts of Spain and the World. In addition, feathers from chicken consupption are dispossed in large quantities, causing acumulation in dumpfields (Fig. 2).

Fig. 1 Large quantities of "lacha" sheep wool being stored without any outcome in Vizcaya region in Spain.

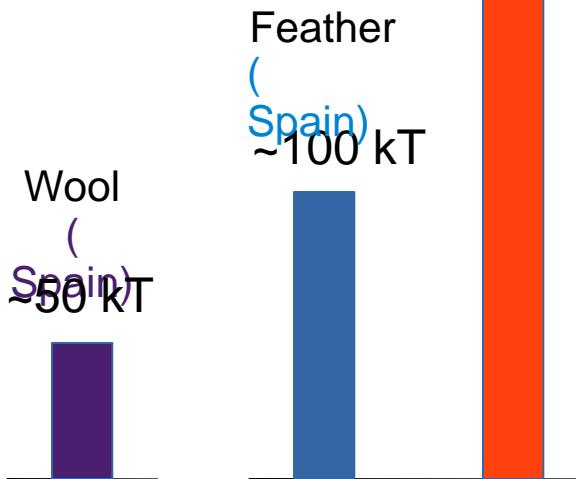

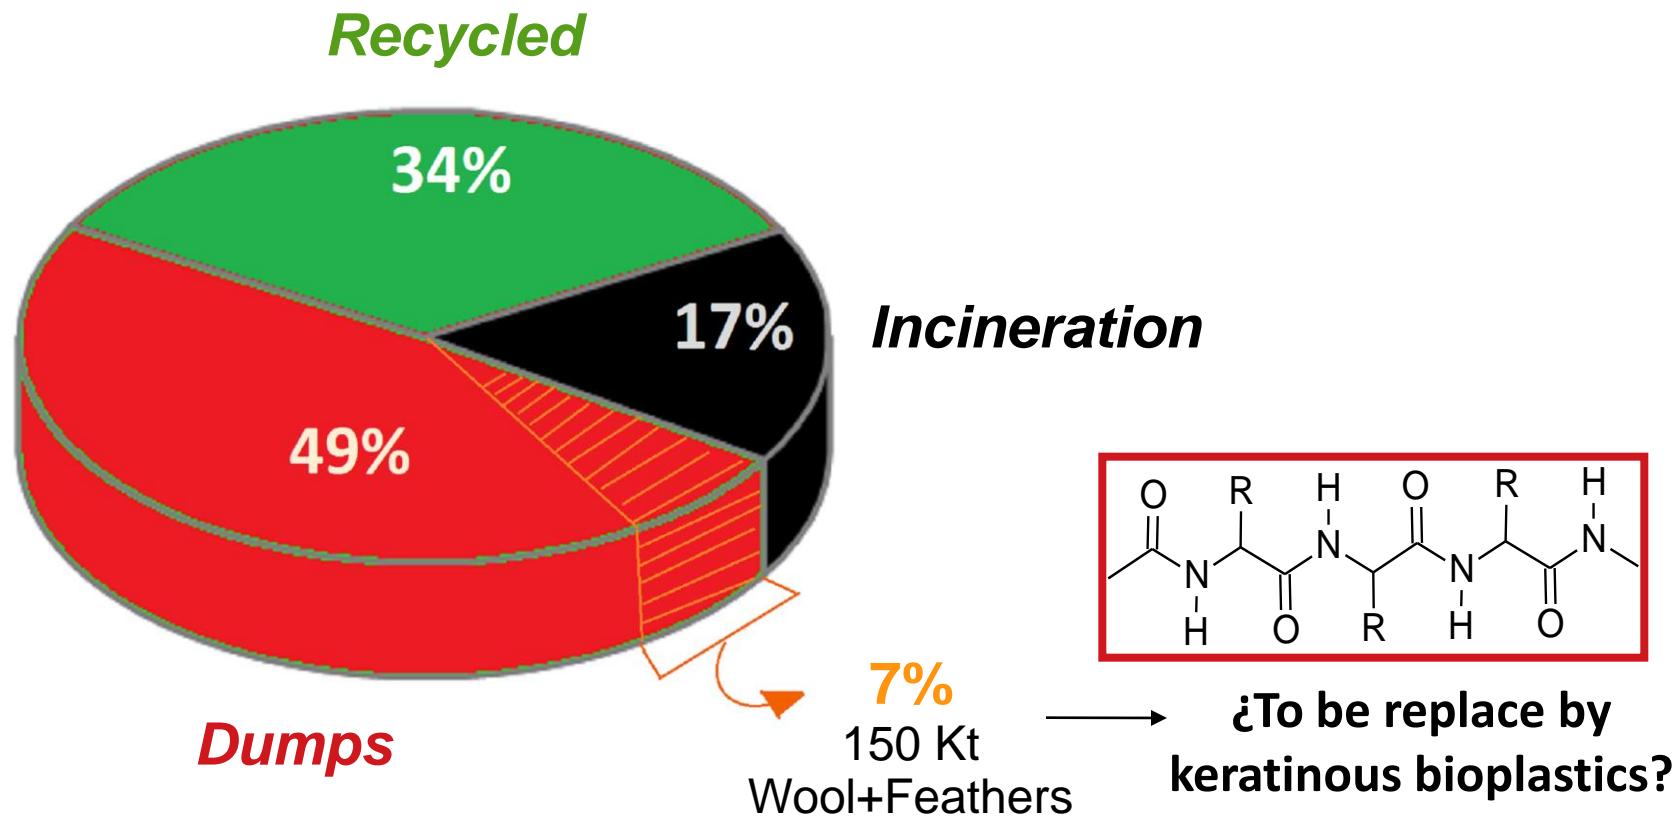

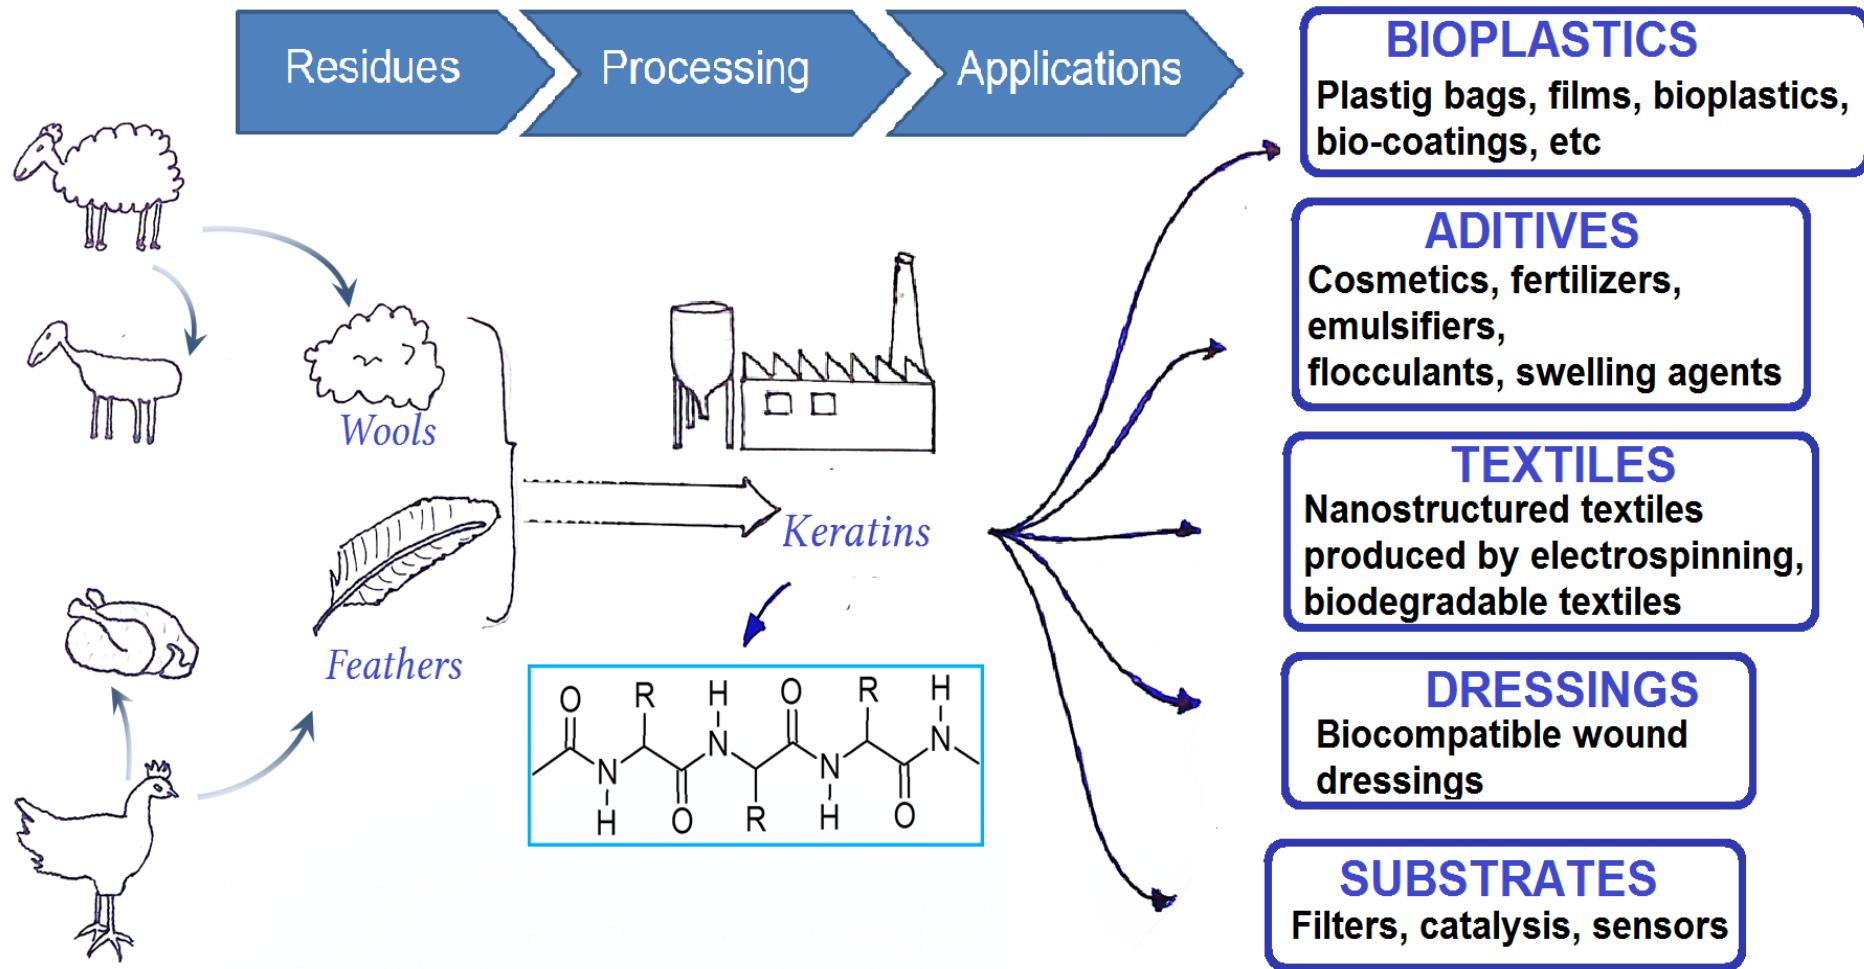

Fig. 2 Volume of Wool and feather residues in Spain and the World.

In Spain (2016) about **2.151 kt** are generated annually. From them, **34% are being recycled**, **17% valorized energetically (burnt)** and about **49% disposed to the dumps**.

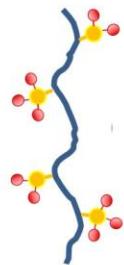

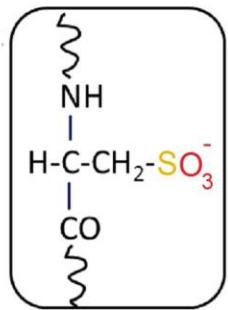

Large tradition of sheep cheese production in Spain, but with outcome problems for wool residues.

Example of Reconversion of these into Bioplastics for *Circular Bioeconomy*.

Extracción
